

Module 5 Project Rubric

TraceLens | Deployed Full-Stack Application | AIE 500 - 10x Coding with AI

C3.1-C3.5 | Application evidence; defense follows in Module 6.

Complete the second backend feature, build React from your frontend spec and deliver a reproducible full-stack TraceLens application.

Evidence to prepare

- Commit specs/frontend.md before React code, naming screens, components/props, routes, state and async behavior.
- Implement the remaining feature and additional backend endpoints test-first; run tests against deployed configuration.
- Verify real dashboard/project/trace journeys, correct pagination, and both evaluations and alert rules through the UI.
- Provide loading, empty and visible error states; document a reproducible deployment or full-stack container run.
- Record honest scaffold-to-first-new-endpoint timestamps, plan and blockers. C3.5 timing requires calibration; see the criterion text.

MUST PASS: C3.3 - App runs end to end

A Not Yet returns this evidence group before its remaining criteria are reviewed.

Same competencies, independent project

Choose TraceLens **instead of PromptLab**. The videos demonstrate PromptLab; apply the methods independently. Both tracks require all 22 criteria to be Met, with no points, averaging or bonus credit.

No weekly capstone upload: keep one repository and authentic evidence for final review. Each module evidence group retains three attempts; returns do not consume one. See ASSESSMENT.md for revision, return and defense policy.

Version: TraceLens Criterion Set v1.1. Original project Modules 1-5 map to current Modules 2-6. The Syllabus governs policy; ALIGNMENT.md records clarifications.

Module 5 | Assessment criteria (1/3)

C3 - End-to-End AI-Assisted Application Delivery

C3.1-C3.5 | Application evidence; defense follows in Module 6.

Criterion	Where your evidence lives	What earns "Met"	Common mistakes
C3.1 - Your structure follows your spec	specs/frontend.md, frontend/src/	The frontend specification is committed before implementation. Every component in your frontend spec exists as its own module, and you can state the organizing principle of your folder structure in one sentence. Backend and frontend concerns stay separate.	- Vite template directories left in unused. - Specified components missing or merged with no explanation. - Concerns tangled across modules.
C3.2 - Your backend increment was built test-first	Commit history for your Module 5 feature; test run against deployed config	The second spec feature, and any endpoints your frontend needs, show a failing test before implementation in commit history. The suite passes against your deployed configuration, not just locally.	- Tests added once the feature was finished. - A suite that passes locally but not against the deployed config. - Tests that exercise FastAPI rather than your own logic.

Source: TraceLens Criterion Set v1.1 (rubrics/CRITERIA.md), adapted from supplied v1.0 and aligned to the current PromptLab course package. All criteria are Met / Not Yet.

Module 5 | Assessment criteria (2/3)

C3 - End-to-End AI-Assisted Application Delivery

C3.1-C3.5 | Application evidence; defense follows in Module 6.

Criterion	Where your evidence lives	What earns "Met"	Common mistakes
C3.3 - Your app runs end to end MUST PASS	Deployed app or documented container run; frontend/, backend/	The deployed application completes its core journeys: dashboard showing real per-project stats, create a project, rename it, delete it with confirmation and your orphaned-trace strategy visibly applied, browse traces filtered by project, model and status, search, paginate with correct page counts, open a trace's detail, and use both evaluations and alert rules end to end. The frontend consumes your real API. Loading and empty states present, and API failures produce visible user-facing messages.	- A frontend running on mocked or hard-coded data. - A core journey breaking partway through. - A pager that still shows the wrong number of pages. - API errors producing a blank screen or nothing at all.

Both features must be usable. Show evaluation entry, trace evaluation lists and project summaries; create/list/delete alert rules and evaluate which trigger. No live LLM calls, paid host, background scheduler or email integration is required.

Source: TraceLens Criterion Set v1.1 (rubrics/CRITERIA.md), adapted from supplied v1.0 and aligned to the current PromptLab course package. All criteria are Met / Not Yet.

Module 5 | Assessment criteria (3/3)

C3 - End-to-End AI-Assisted Application Delivery

C3.1-C3.5 | Application evidence; defense follows in Module 6.

Criterion	Where your evidence lives	What earns "Met"	Common mistakes
C3.4 - Someone else could deploy it	docs/deployment.md, committed configuration	A second person can deploy or run TraceLens using only what's committed. Every step, environment variable and secrets-handling approach is documented.	- Deployment relying on something you configured by hand and never wrote down. - Instructions missing environment variables. - Only a running instance, with no reproducible path to it.
C3.5 - You worked inside the time budget	Commit timestamps for the Module 5 backend increment	Record genuine commits from scaffolding the Module 5 backend increment to its first passing new endpoint, plus the advance plan and blockers. The original four-hour figure is unvalidated: timing-based Not Yet requires pilot calibration, a published budget and a criterion-version update. Pending calibration is not automatic Met. The interval does not cover the entire application.	- Going over with no blocker documented. - Committing everything in one batch, so timestamps prove nothing. - Committing unfinished work to hit the time and finishing later.

Timing policy shared with PromptLab. The old four-hour figure is not yet a validated cutoff. Preserve real timestamps and blockers; calibration and a versioned published budget must precede timing-based Not Yet. Pending calibration does not itself earn Met.
